

WHO HURTS MOST

ZeToD (Zero To Deploy)

The User

Across Africa, thousands of young people are actively learning Python through bootcamps, YouTube, university courses, and self study. They are motivated, they are putting in the hours, and they genuinely want to build careers in tech.

But they have one invisible problem that is costing them opportunities every single day.

They have no honest way to know where they actually stand.

Where They Are

They are in Lagos, Nairobi, Accra, Kampala, and Kigali. They are in their rooms, in co-working spaces, in university labs. They finish courses, they complete tutorials, they build small projects and then they apply for jobs or freelance opportunities and get rejected without understanding why.

Some overestimate themselves and walk into interviews unprepared. Others underestimate themselves and never apply at all. Both groups are losing.

What Hurts

The pain is not a lack of learning resources. Africa has never had more access to free Python content than it does today.

The pain is the absence of an honest mirror.

There is no tool that looks at what an African developer actually knows, compares it to what the job market actually requires, and says clearly you are a beginner, you are intermediate, or you are job ready. And if you are not job ready yet, here is exactly what you need to work on.

Certificates from online courses are not trusted by employers. University degrees do not prove practical ability. Self assessment is unreliable. And professional certifications are expensive and inaccessible to most.

The result is a generation of capable developers who cannot prove their capability and employers who cannot identify talent efficiently.

The Cost of This Problem

For the individual lost job opportunities, wasted time preparing for the wrong things, and a creeping self doubt that kills momentum.

For the ecosystem companies hiring the wrong people, bootcamps producing graduates with no benchmark, and African tech talent remaining invisible to the global market.

What ZeToD Does

ZeToD is an open source Python skill assessment platform that measures a developer's accuracy, speed, and knowledge depth against an expert benchmark and tells them exactly where they stand.

Beginner. Intermediate. Job Ready.

No guessing. No false certificates. Just an honest score and a clear roadmap of what to study next.

Built in Africa. Built for Africa. Completely free.
